

Total time in the A&E department

Site-level performance

Site performance against performance thresholds

Description of Data

The Total Time in the A&E Department indicator looks at all attendances to the Emergency Department and measures the time between when the patient first arrived and the time the patient was either admitted, transferred or discharged, i.e. the total time spent in the A&E department.

The target for the Total Time in the A&E Department is that 95% of attendances to the Emergency Department should spend 240 minutes (4 hours) or less in the department in total.

The Trust has measured this target for a number of years and had achieved the requirement until April 2013 when the target was failed for the first time. Since April 2013 this target has been achieved consistently and more than 95% of people attending the Emergency Department at Sheffield Children's Hospital in November 2013 were seen and either admitted or sent home within 4 hours. Sometimes patients are in the Emergency Department longer than 4 hours if they are quite poorly and need a lot of clinical attention before they can be moved on to a more appropriate area within the hospital.

Time to Initial Assessment

Site-level performance

Description of Data

The Time to Initial Assessment indicator looks at all patients who arrived by Emergency Ambulance and measures the time between when the patient first arrived in the Emergency Department and the time they received their initial assessment.

The target for Time to Initial Assessment is that 95% of patients who arrive by Emergency Ambulance should receive their initial assessment within 15 minutes of arrival.

This measures how long patients wait to be seen by a nurse or a doctor when they come to the Emergency department by ambulance. For adults this is a useful way of measuring whether the sickest patients are seen quickly. The Trust continues to meet this target, however for children it is important to realise that not all sick children come by ambulance; some very unwell children are brought by their parents in their own.

12 95th percentile this month

Time to Treatment

Site-level performance

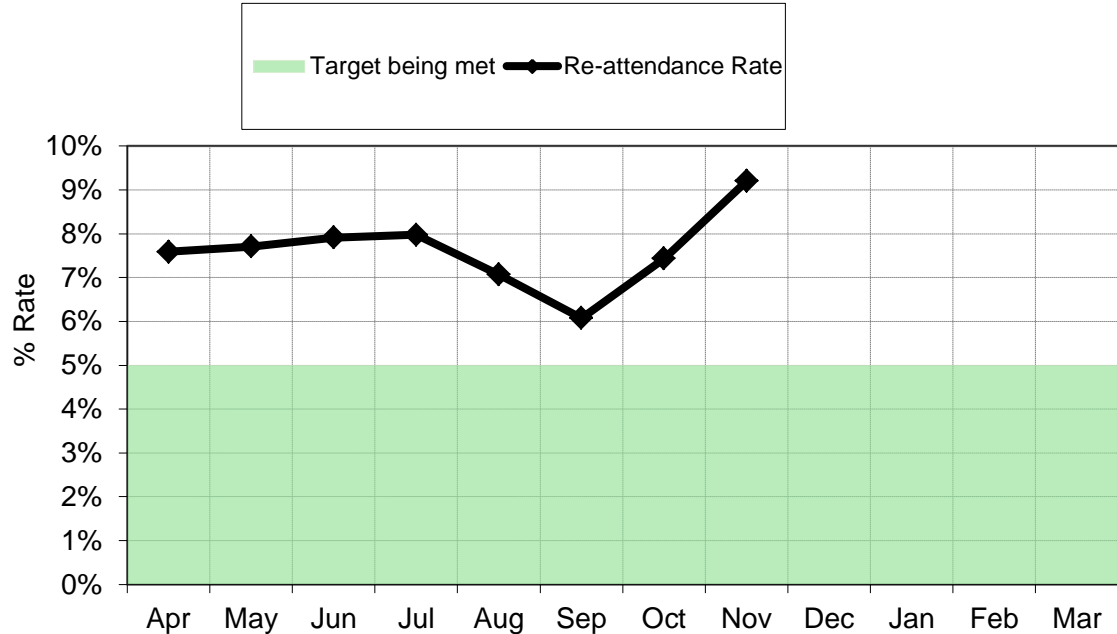

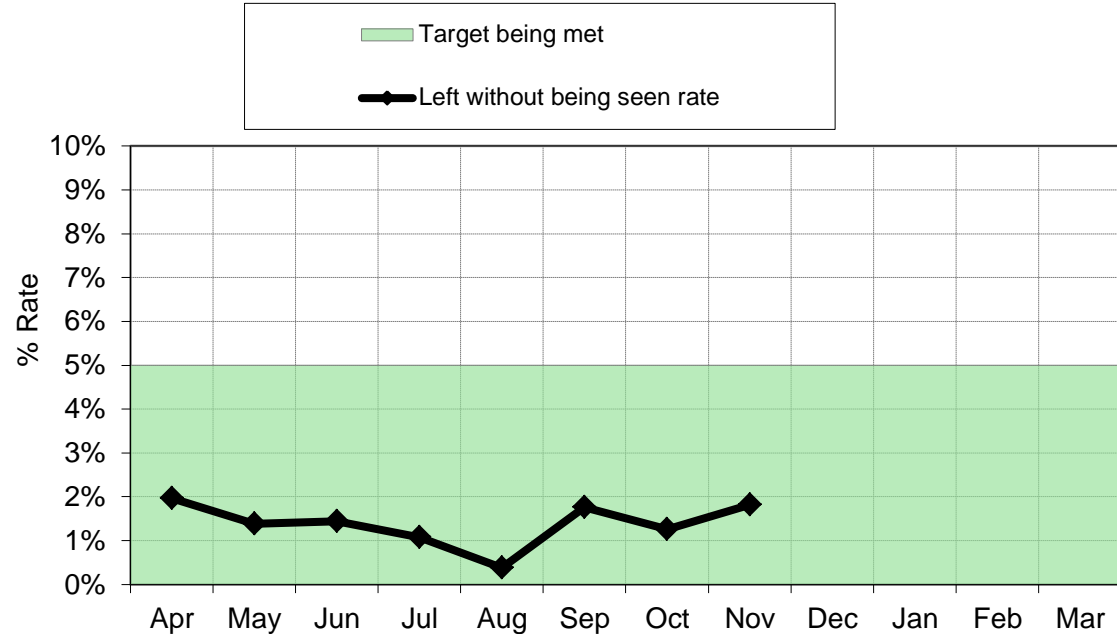

Description of Data

The Time to Treatment indicator looks at all attendances to the Emergency Department and measures the time between when the patient first arrived and the time they were seen by a clinician who can diagnose the problem and arrange or start treatment, known as the decision-making clinician.

The target for Time to Treatment is that 50% of attendances to the Emergency Department should see the decision-making clinician within 60 minutes of arrival.

For this target at least half the people coming to the department should see someone who can make a decision about their treatment (this could be a nurse or a doctor) within 60 minutes. The Trust continues to exceed this target.

Re attendance within 7 days is more common in children than in adults as children more often suffer different conditions within a shorter time span, for example having an accident and then later a chest infection. This indicator is not sufficiently sensitive to separate these issues out however the Department of Health require that all Trusts be measured against this target. The Trust has revised the methodology in calculating performance so it is the same as the method used by the Department of Health and as a result, this target is showing as not being achieved. For children, we would always say if you remain worried about your child when you have gone home, or the situation changes do come back, or if appropriate make an appointment with your GP if this can be done in a timely way.		9.2%	Rate this month	The Trust continues to achieve this target and shows that not many patients who come to the hospital leave before being seen by a clinical member of staff. Sometimes, when the hospital is busy the number of people who leave without being seen can increase.		1.8%	Rate this month
